What are User Actors?

User actors are important to bring order to your Isadora patch. They help organize your patch and think about your program in order of modules. You can compare it with function/object based programming. You can put user actors inside useractors but be careful.

Tips&Tricks:

- Build up slowly and add inputs/outputs as needed
- You can label your inputs/outputs to know what they are
- You can label your user actor so you know what it does
- Inputs/Outputs are Mutable and you can set the type
- You can change the sequence of your user actor inputs/outputs
- There is a difference between UserActors and Macro's
